### ABSTRACT

This paper presents an empirical investigation to study the effect of industry type on relationship between Tobin's Q and working capital management among selected firms from Tehran Stock Exchange. The proposed study gathers the necessary financial information from 219 different firms over the period 2001-2011 and categorizes them based on different sectors. There are five independent variables including current ratio, the ratio of current assets to total assets, debt ratio, the ratio of current liabilities to total assets and total cash. Using a linear regression by considering type of industry as dummy variable, the study detects that there was a positive and meaningful relationship between working capital and Tobin-Q in various industries.

## 1. Introduction

Working capital plays essential role on financial management and there are many studies to find how this could increase profitability of an organization (Filbeck & Krueger, 2005). Deloof (2003) investigated the relationship between working capital management and corporate profitability for a sample of 1,009 large Belgian non-financial companies over the period 1992-1996. The author computed trade credit policy and inventory policy by number of days' accounts receivable, accounts payable and inventories, and applied the cash conversion cycle as a comprehensive measure of working capital management. They reported that managers could increase corporate profitability by reducing the number of days' accounts receivable and inventories. Eljelly (2004) investigated the relationship between profitability and liquidity measured by current ratio and cash gap on a sample of

E-mail address: m\_khodaei@iaunb.ac.ir (M. Khodaei Valahzaghari)

joint stock companies in Saudi Arabia. Using correlation and regression analysis the study reported substantial negative relationship between the firm's profitability and its liquidity level, as measured by current ratio. This relationship was more evident in firms with high current ratios and longer cash conversion cycles. At the industry level, nevertheless, the study detected that the cash conversion cycle or the cash gap was of more importance as a measure of liquidity than current ratio that influences profitability. The size variable was also detected to have significant impact on profitability at the industry level. Samiloglu and Demirgunes (2008) investigated the effect of working capital management on firm profitability by looking into some evidence from Turkey. García-Teruel and Martínez-Solano (2007) provided some empirical evidence on the effects of working capital management on the profitability of a sample of small and medium-sized Spanish firms. Gardner et al. (1986) investigated working capital policy and operating risk. Padachi (2006) studied trends in working capital management and its impact on firms' performance.

## 2. The proposed study

This paper presents an empirical investigation to study the effect of industry type on relationship between Tobin's Q and working capital management among selected firms from Tehran Stock Exchange (Gundavelli, 2006). The proposed study gathers the necessary financial information from 219 different firms over the period 2001-2011 and categorizes them based on nine different sectors. There are five independent variables including current ratio, the ratio of current assets to total assets, debt ratio, the ratio of current liabilities to total assets and total cash.

$CR_{it}(nt)$  = Cash of the firm (industry)  $i(n)$  in time  $t$ ,

$CACLR_{it}(nt)$  = Current assets to current liabilities of firm (industry)  $i(n)$  for time  $t$ ,

$CATAR_{it}(nt)$  = Current assets to total assets of firm (industry)  $i(n)$  in time  $t$ ,

$CLTAR_{it}(nt)$  = Current liabilities to total assets of firm (industry)  $i(n)$  in time  $t$ ,

$DR_{it}(nt)$  = Total debt to total assets of firm (industry)  $i(n)$  in time  $t$ ,

$e$  = error term of the model

There are two regression models and two dependent variables as follows,

$TQ_{it}$  = Tobin's Q of firm  $i$  for time  $t$ ,

$TQ_{nt}$  = Tobin's Q of industry  $i$  for time  $t$ .

Tobin's Q is calculated as  $Tobin's\ Q = (MVE + BVE) / TAE$  where  $MVE$  represents market value of equity,  $BVE$  is equal to total liabilities of the firms, which are subject to interest and  $TAE$  is equal to total assets of the firm (Chung & Pruitt, 1994). The proposed model of this paper uses the following two models to verify the hypothesis of this survey,

$$TQ_{it} = \beta_0 + \beta_1 (cr_{i,t}) + \beta_2 (caclr_{i,t}) + \beta_3 (catar_{i,t}) + \beta_4 (cltar_{i,t}) + \beta_5 (dr_{i,t}) + \varepsilon_{i,t} \quad (1)$$

$$TQ_{nt} = \beta_0 + \beta_1 (cr_{n,t}) + \beta_2 (caclr_{n,t}) + \beta_3 (catar_{n,t}) + \beta_4 (cltar_{n,t}) + \beta_5 (dr_{n,t}) + \varepsilon_{n,t} \quad (2)$$

Table 1 demonstrates the summary of some basic statistics on some selected data.

**Table 1**  
The summary of some basic statistics

Variable	#	Mean	Standard dev.	Variance	Skewness	Kurtosis	Deviation	
							Skewness	Kurtosis
Current ratio	1971	1.089	0.565	0.319	2.521	12.931	45.732	117.334
Current assets to total assets	1971	0.616	0.208	0.043	-0.630	-0.377	11.428	-3.420
Current liabilities to total assets	1971	0.659	0.416	0.173	5.581	53.650	101.230	486.811
Total debt to total assets	1971	0.760	0.421	0.177	5.541	51.899	100.500	470.917
Cash of the firm	1971	0.068	0.077	0.006	3.977	31.052	72.144	281.755
Tobin's Q	1971	0.925	1.174	1.377	3.772	18.488	68.418	167.754

Since the proposed study of this paper intends to use linear regression technique, we need to make sure about the normality of data. Table 2 summarizes the results of our survey based on three different statistical observations and the results indicate that the data were not normally distributed.

**Table 2**

The summary of Kolmogorov-Smirnov, Shapiro-Wilk and Jarque- Bera

Variable	#	Kolmogorov-Smirnov		Shapiro-Wilk		Jarque- Bera	
		Statistic	Error	Statistic	Error	Statistic	Error
Current ratio	1971	.124	0.000	.829	0.000	15741.53	0.000000
Current assets to total assets	1971	.084	0.000	.954	0.000	141.9983	0.000000
Current liabilities to total assets	1971	.191	0.000	.616	0.000	245378.7	0.000000
Total debt to total assets	1971	.226	0.000	.600	0.000	230126.2	0.000000
Cash of the firm	1971	.189	0.000	.692	0.000	83957.71	0.000000
Tobin's Q	1971	.219	0.000	.603	0.000	32585.63	0.000000

Table 3 also summarizes the results of different statistics to verify whether we should use pooled or panel method.

**Table 3**

The summary of

Group	Goal	F	Chow		Chi-Square	Hausman	
			Sig.	Result		Sig.	Result
1 Total	Pooled	18.797216	0.0000	Not equal intercept	0.000000	1.0000	Random Effects
	Panel	6.522316	0.0000	Not equal slope	4.891623	0.4292	Random Effects
2 Solid Sugar and sugar	Pooled	2.581183	0.0117	Not equal intercept	0.000000	1.0000	Random Effects

3 Food excluding sugar	Pooled	2.523603	0.0117	Not equal intercept	2.791580	0.7321	Random Effects
	Panel	1.545395	0.0426	Not equal slope	2.813692	0.7287	Random Effects
4 Plastic and rubber	Pooled	0.880886	0.5348	Equal intercept			
	Panel	2.903612	0.0009	Not equal slope	2.835487	0.7253	Random Effects
5 Basic metals	Pooled	2.228883	0.0266	Not equal intercept	7.758015	0.1701	Random Effects
	Panel	1.320228	0.1544	Equal slope			
6 Equipment and machinery	Pooled	2.622964	0.0091	Not equal intercept	18.104703	0.0028	Fixed Effects
	Panel	2.107326	0.0018	Not equal slope	14.172157	0.0146	Fixed Effects
7 Part makers	Pooled	6.115038	0.0000	Not equal intercept	0.000000	1.0000	Random Effects
	Panel	2.638049	0.0001	Not equal slope	48.393902	0.0000	Fixed Effects
8 Non-metal	Pooled	1.235182	0.2811	Equal intercept			
	Panel	3.571285	0.0000	Not equal slope	1.501496	0.9129	
9 Cement	Pooled	12.294129	0.0000	Not equal intercept	10.815195	0.0552	Random Effects
	Panel	3.359057	0.0000	Not equal slope	21.822508	0.0006	Fixed Effects
10 Drug	Pooled	10.689500	0.0000	Not equal intercept	11.557458	0.0414	Random Effects
	Panel	3.549734	0.0000	Not equal slope	28.639809	0.0000	Fixed Effects

Now, we are able to consider other important relationship among independent components and residuals. Table 4 summarizes the results of F-statistics, Durbin-Watson, etc.

**Table 4**

The summary of F-statistics, Durbin-Watson and J B

Model	Linearity test		Durbin-Watson		Residual test	
	F	Sig.	Value	Range	J_B statistics	Sig.
1	17.61734	0.000000	1.584184	2.5-1.5	138.50	0.000000
2	6.059623	0.000039	1.546586	2.5-1.5	44.16	0.000000
3	6.566695	0.000009	1.519414	2.5-1.5	201.116	0.000000
4	2.567749	0.001092	1.736060	2.5-1.5	2569.144	0.000000
5	5.356019	0.000115	1.603270	2.5-1.5	9294.388	0.000000
6	2.962216	0.000000	1.721660	2.5-1.5	13161.45	0.000000
7	6.430626	0.000000	1.540982	2.5-1.5	994.257	0.000000
8	2.331074	0.044154	1.581440	2.5-1.5	1676.694	0.000000
9	5.171825	0.000000	1.587526	2.5-1.5	33.615	0.000000
10	7.695595	0.000000	1.504611	2.5-1.5	156.3738	0.000000

As we can observe from the results of Table 4, all F-value statistics are significant with  $\alpha = 5\%$ . In addition, all Durbin-Watson values are within acceptable limit, which means there is no autocorrelation among residuals. Finally, we have considered the correlation ratios among independent variables and we may precede the regression analysis.

### 3. The results

In this section, we present details of our investigation on measuring the impact of various factors on Tobin's Q. The results of linear regression model are given in Eq. (3) as follows,

$$TQ = 1.217 + 0.114*CACLR + 0.068*CATAR + 1.284*CLTAR - 1.218*DR + 1.091*CR - 0.8469*DUM1 - 0.7763*DUM2 - 0.82*DUM3 - 0.703906620522*DUM4 - 0.919*DUM5 - 0.828*DUM6 - 0.81*DUM7 + 1.27*DUM8 \quad (4)$$

In Eq. (4), F-value = 17.61734, Durbin-Watson = 1.584184 and Adjusted R-Square = 0.104768. In addition, all t-student values are statistically significance with  $\alpha=5\%$ . Therefore, we can confirm the main hypothesis of this survey and conclude that working capital positively influences Tobin-Q.

#### 3.1. The effect of working capital on Tobin-Q in Sugar industry

The first sub-hypothesis of this survey is associated with the effect of working capital on Tobin-Q in Sugar industry, which is summarized in Eq. (5) as follows,

$$TQ = 0.392 + 0.349*CACLR - 0.535*CATAR - 0.328*CLTAR + 0.399*DR + 1.044*CR \quad (5)$$

In Eq. (5), F-value = 6.059623, Durbin-Watson = 1.546586 and Adjusted R-Square = 0.142687. In addition, all t-student values are statistically significance with  $\alpha=5\%$ . Therefore, we can confirm the first sub-hypothesis of this survey and conclude that working capital positively influences Tobin-Q in sugar industry.

#### 3.2. The effect of working capital on Tobin-Q in Food industry excluding sugar

The second sub-hypothesis of this survey is associated with the effect of working capital on Tobin-Q in Food industry excluding sugar, which is summarized in Eq. (6) as follows,

$$TQ = 0.805 + 0.232*CACLR - 0.766*CATAR + 0.472*CLTAR - 0.463*DR + 0.810*CR \quad (6)$$

In Eq. (6), F-value = 6.566695, Durbin-Watson = 1.519414 and Adjusted R-Square = 0.093768. In addition, most t-student values are statistically significance with  $\alpha=5\%$ . Therefore, we can confirm the second sub-hypothesis of this survey and conclude that working capital positively influences Tobin-Q in food industry.

#### 3.3. The effect of working capital on Tobin-Q in Rubber and Plastic

The third sub-hypothesis of this survey is associated with the effect of working capital on Tobin-Q in Rubber and Plastic industry, which is summarized in Eq. (7) as follows,

$$TQ = 0.805 + 0.232*CACLR - 0.766*CATAR + 0.472*CLTAR - 0.463*DR + 0.810*CR \quad (7)$$

In Eq. (7), F-value = 2.567749, Durbin-Watson = 1.736060 and Adjusted R-Square = 0.023637. In addition, most t-student values are statistically significance with  $\alpha=5\%$ . Therefore, we can confirm the third sub-hypothesis of this survey and conclude that working capital positively influences Tobin-Q in Rubber and Plastic industry.

### 3.4. The effect of working capital on Tobin-Q in Basic metals

The fourth sub-hypothesis of this survey is associated with the effect of working capital on Tobin-Q in basic metals industry, which is summarized in Eq. (8) as follows,

$$TQ = 0.332 + 0.297*CACLR - 0.227*CATAR + 0.823*CLTAR - 0.718*DR + 2.174*CR \quad (8)$$

In Eq. (8), F-value = 5.356019, Durbin-Watson = 1.603270 and Adjusted R-Square = 0.088616. In addition, most t-student values are statistically significance with  $\alpha=5\%$ . Therefore, we can confirm the fourth sub-hypothesis of this survey and conclude that working capital positively influences Tobin-Q in basic metals industry.

### 3.5. The effect of working capital on Tobin-Q in machinery and equipment

The fifth sub-hypothesis of this survey is associated with the effect of working capital on Tobin-Q in machinery and equipment industry, which is summarized in Eq. (9) as follows,

$$TQ = 0.663 + 0.107*CACLR - 0.349*CATAR + 0.0657*CLTAR - 0.164*DR + 1.047*CR \quad (9)$$

In Eq. (9), F-value = 2.962216, Durbin-Watson = 1.721660 and Adjusted R-Square = 0.238213. In addition, most t-student values are statistically significance with  $\alpha=5\%$ . Therefore, we can confirm the fifth sub-hypothesis of this survey and conclude that working capital positively influences Tobin-Q in machinery and equipment industry.

### 3.6. The effect of working capital on Tobin-Q in Auto industry

The sixth sub-hypothesis of this survey is associated with the effect of working capital on Tobin-Q in Auto industry, which is summarized in Eq. (10) as follows,

$$TQ = 0.795 + 0.055*CACLR - 0.264*CATAR + 0.284*CLTAR - 0.402*DR - 0.060*CR \quad (10)$$

In Eq. (10), F-value = 6.430626, Durbin-Watson = 1.540982 and Adjusted R-Square = 0.219523. In addition, most t-student values are statistically significance with  $\alpha=5\%$ . Therefore, we can confirm the sixth sub-hypothesis of this survey and conclude that working capital positively influences Tobin-Q in Auto industry.

### 3.7. The effect of working capital on Tobin-Q in Cement industry

The seventh sub-hypothesis of this survey is associated with the effect of working capital on Tobin-Q in Cement industry, which is summarized in Eq. (11) as follows,

$$TQ = 0.826 - 0.567*CACLR + 5.401*CATAR + 3.641*CLTAR - 2.450*DR + 2.254*CR \quad (11)$$

In Eq. (11), F-value = 5.171825, Durbin-Watson = 1.587526 and Adjusted R-Square = 0.348283. In addition, most t-student values are statistically significance with  $\alpha=5\%$ . Therefore, we can confirm the seventh sub-hypothesis of this survey and conclude that working capital positively influences Tobin-Q in Cement industry.

### 3.8. The effect of working capital on Tobin-Q in Drug industry

The eighth sub-hypothesis of this survey is associated with the effect of working capital on Tobin-Q in Drug industry, which is summarized in Eq. (12) as follows,

$$TQ = 3.465 - 0.99*CACLR - 0.674*CATAR + 0.996*CLTAR - 3.113*DR + 0.458*CR \quad (12)$$

In Eq. (12), F-value = 7.695595, Durbin-Watson = 1.504611 and Adjusted R-Square = 0.516213. None of the t-student values is statistically significance with  $\alpha=5\%$  or even  $\alpha=10\%$ . Therefore, we cannot confirm the eighth sub-hypothesis of this survey and conclude that working capital positively influences Tobin-Q in Drug industry.

#### 4. Conclusion

In this paper, we have presented an empirical investigation to study the effect Tobin-Q on working capital on selected firms from Tehran Stock Exchange. We have examined the main hypothesis of this survey in all industries as well as individual industries. Table 5 shows details of our findings,

**Table 5**  
The summary of investigating various hypotheses

Industry	Cash ratio	Current ratio	Ratio of current assets to total assets	Ratio of current liabilities to total assets	Debt ratio
